

I took control of my
aortic stenosis.

Understanding the need for timely treatment and all of your treatment options for severe aortic stenosis once you have symptoms, including transcatheter aortic valve replacement (TAVR)

Edwards

Aortic Stenosis Is Serious

2.5 million

Approximately 2.5 million Americans over 75 years of age are affected by aortic stenosis.

Are you finding it harder to walk the same distance you did 6 months ago? It may not be your age. **It may be your heart.**

Aortic stenosis is a progressive disease that will worsen over time.

Often, the symptoms of aortic stenosis are mistaken as normal signs of aging.

Symptoms of severe aortic stenosis

Shortness of breath

Swollen ankles and feet

Difficulty walking

Not engaging in activities you used to enjoy

Rapid heartbeat

Feeling dizzy or lightheaded

Difficulty sleeping

Fainting

It takes courage to speak up about your aortic stenosis. Once it becomes severe, treatment may be necessary. Talk with your doctor about any symptoms you may have. Get an echocardiogram, a test that will monitor your aortic stenosis and will let your doctor know when it's time to get treatment.

How severe is my aortic stenosis?

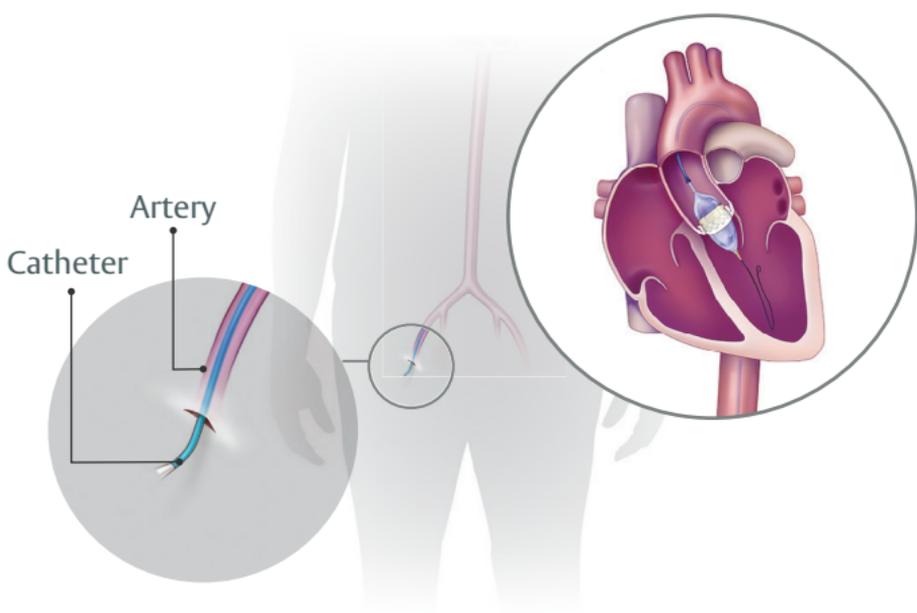

Know the Importance of Timely Treatment

Take back your future by starting discussions with your doctor about treatment options as soon as your aortic stenosis is diagnosed.

As your aortic stenosis becomes severe and you have symptoms, the only effective way to treat it is to replace your heart valve.

Today, patients who have severe aortic stenosis and are experiencing symptoms have two options to replace their aortic valve: **TAVR** (transcatheter aortic valve replacement) or open heart surgery (also known as surgical aortic valve replacement, or **SAVR**).

TAVR procedure

TAVR is a less invasive procedure that doesn't require open heart surgery. The most common technique involves a small incision made in the leg, where a catheter will be inserted into your artery to replace your diseased valve while your heart is still beating.

How will I know when it's time to act and replace my heart valve?

Your Best Life Starts Now With TAVR

In 2019, TAVR was performed more often than open heart surgery in patients who had severe aortic stenosis.

The benefits of TAVR may include

- Improved quality of life
- Less invasive procedure with minimal scarring*
- Shorter recovery time to getting back to everyday activities*
- Shorter hospital stay*
- Less pain and anxiety*
- Relief of symptoms

**When compared to open heart surgery*

1
hour

On average, the TAVR procedure lasts about 1 hour, versus 4 hours with open heart surgery.

The major risks of TAVR are similar to open heart surgery and include death, stroke, serious damage to the arteries, or serious bleeding.

How can I be sure that I'm being evaluated for all treatment options available for severe aortic stenosis?

Put Your Future First With TAVR

Don't wait until severe aortic stenosis completely disrupts your life before seeking treatment. It's important to be proactive and find out if TAVR is the right treatment for you.

Severe aortic stenosis can be scary, but your treatment does not have to be. Start by talking with your doctor about finding the best treatment to meet your needs. Make sure you discuss the benefits and risks of each treatment, including TAVR.

Ask to be evaluated by a TAVR Heart Team. TAVR can be performed only by a trained TAVR Heart Team at certain hospitals. Visit NewHeartValve.com to find a TAVR Heart Team nearest to you.

How will TAVR help me live my best life?

Questions to Ask Your Doctor

Put your heart health first by asking the right questions and being informed about your aortic stenosis.

- How do I know if the symptoms I'm feeling have to do with my heart?
- Is my aortic stenosis severe?
- How often will I need an echocardiogram to monitor my aortic stenosis?
- How can I get evaluated for all my treatment options once my aortic stenosis becomes severe?
- How soon will I need treatment once I have severe aortic stenosis?

Order a free TAVR information kit, including a doctor discussion guide and other helpful tools.

Important Risk Information

Edwards SAPIEN 3, Edwards SAPIEN 3 Ultra, and Edwards SAPIEN 3 Ultra RESILIA Transcatheter Heart Valve System

Indications:

The Edwards SAPIEN 3, SAPIEN 3 Ultra and SAPIEN 3 Ultra RESILIA Transcatheter Heart Valve system is indicated for relief of aortic stenosis in patients with symptomatic heart disease due to severe native calcific aortic stenosis who are judged by a Heart Team, including a cardiac surgeon, to be appropriate for the transcatheter heart valve replacement therapy.

The Edwards SAPIEN 3, SAPIEN 3 Ultra and SAPIEN 3 Ultra RESILIA Transcatheter Heart Valve system is indicated for patients with symptomatic heart disease due to failing (stenosed, insufficient, or combined) of a surgical or transcatheter bioprosthetic aortic valve, a surgical bioprosthetic mitral valve, or a native mitral valve with an annuloplasty ring who are judged by a Heart Team, including a cardiac surgeon, to be at high or greater risk for open surgical therapy (i.e., predicted risk of surgical mortality $\geq 8\%$ at 30 days, based on the Society of Thoracic Surgeons (STS) risk score and other clinical co-morbidities unmeasured by the STS risk calculator).

Contraindications (Who should not use):

The Edwards SAPIEN 3, Edwards SAPIEN 3 Ultra and SAPIEN 3 Ultra RESILIA Transcatheter Heart Valve System should not be used in patients who:

- Cannot tolerate medications that thin the blood or prevent blood clots from forming.
- Have an active infection in the heart or elsewhere.
- Have a mitral ring that is damaged and can no longer support the valve.

Warnings:

- There may be an increased risk of stroke in transcatheter aortic valve replacement procedures, compared to other standard treatments for aortic stenosis in the high or greater risk population.
- If an incorrect valve size for your anatomy is used, it may lead to heart injury, valve leakage, movement, or dislodgement.
- Patients should talk to their doctor if they have significant heart disease, a mitral valve device or are sensitive to anesthesia, contrast media, cobalt, nickel, chromium, molybdenum, titanium, manganese, silicon, and/or plastics.

- The Edwards SAPIEN 3 Ultra, SAPIEN 3 Ultra RESILIA and SAPIEN 3 valves may not last as long in younger patients, or patients with a disease that results in more calcium in their blood.
- During the procedure, your doctors should monitor the dye used in the body; if used in excess it could lead to kidney damage. X-ray guidance used during the procedure may cause injury to the skin, which may be painful, damaging, and long-lasting.
- Patient's creatinine level should be measured prior to the procedure.
- Patients who have already had a valve replaced should be carefully assessed by their physician prior to receiving a new valve to ensure proper placement of the new valve.
- Injury can occur if the delivery system is not used properly.
- Transcatheter heart valve patients should talk to their physicians about the potential need for medications that thin the blood or prevent blood clots from forming. Patients who do not may be at increased risk of a stroke. Blood-thinning medication may increase the risk of bleeding in the brain (stroke).
- Transcatheter valve replacement is not recommended in previous mitral valve rings that are damaged or have become too rigid.

Precautions:

The long-term durability of the Edwards SAPIEN 3 Ultra, SAPIEN 3 Ultra RESILIA and SAPIEN 3 transcatheter heart valves are not known at this time. Regular medical follow-up is recommended to evaluate how well a patient's heart valve is performing. Limited clinical data are available for transcatheter aortic valve replacement in patients who are born with an aortic heart valve that has only two leaflets and who are determined to be at low risk for open heart surgery. A patient's anatomical characteristics should be considered by their physicians when using the valve in this patient population. In addition, patient age should be considered as long-term durability of the valve has not been established. Patients who need a dental procedure should talk to their doctor about risk of infection and needing antibiotics. Patients should be treated post-procedure for heart infection as a precaution.

The safety and effectiveness of the transcatheter heart valves are also not known for patients who have:

- An aortic heart valve that is not calcified, contains only one leaflet, has leaflets with large pieces of calcium that may block the vessels that supply blood to the heart or in which the main problem is that the valve leaks.
- Who have a prosthetic ring in the tricuspid position.
- A heart that does not pump well, has thickening of the heart muscle, with or without blockage, unusual ultrasound images of the heart that could represent irregularities such as a blood clot, a diseased mitral valve that is calcified or leaking, or Gorlin syndrome, a condition that affects many areas of the body and increases the risk of developing various cancers and tumors.

- Low white, red or platelet blood cell counts, or history of bleeding because the blood does not clot properly.
- Diseased, abnormal, or irregularly shaped vessels leading to the heart. Vessels which are heavily diseased or too small for the delivery devices, or a large amount of calcification at the point of entry.
- Allergies to blood-thinning medications or dye injected during the procedure.
- Whose previously implanted artificial valve or ring is not securely in place or is damaged that could cause it to leak.
- Whose previously implanted valve or ring could block a blood vessel caused from the leaflet partially detaching.

Potential risks associated with the procedure include:

- Death, stroke, paralysis (loss of muscle function), permanent disability, or severe bleeding.
- Risks to the heart, including heart attack or heart failure, sudden loss of heart function, a heart that does not pump well, irregular heartbeat that may result in a need for a permanent pacemaker, chest pain, heart murmur, false aneurysm, recurring aortic stenosis (narrowing), too much fluid around the heart, injury to the structure of the heart.
- Risks to your lungs or breathing, including difficulty breathing, fainting, dizziness, buildup of fluid in or around the lungs, weakness, or inability to exercise.
- Risks involving bleeding or your blood supply, including formation of a blood clot, high or low blood pressure, limited blood supply, a decrease in red blood cells, or abnormal lab values, bleeding in the abdominal cavity, collection of blood under the skin, serious damage to the arteries, severe bleeding in the heart or in the body that could require a transfusion or surgery.
- Additional risks, including life-threatening infection, dislodgement of calcified material, air embolism (air bubbles in the blood vessels), poor kidney function or failure, nerve injury, fever, allergic reaction to anesthesia or dye, reoperation, pain, infection, or bleeding at incision sites, or swelling.

Additional potential risks specifically associated with the use of the heart valves include:

- Valve movement after deployment, blockage or disruption of blood flow through the heart, need for additional heart surgery or emergency heart surgery and possible removal of the Edwards SAPIEN 3 Ultra, SAPIEN 3 Ultra RESILIA and SAPIEN 3 valves, a blood clot that requires treatment, damage to the valve (e.g., wear, breakage, recurring aortic stenosis), valve issues not related to structure (e.g., leakage, inappropriate sizing or positioning, blockage, excess tissue in growth, blood cell damage) or mechanical failure of the delivery system and/or accessories.

CAUTION: Federal (United States) law restricts these devices to sale by or on the order of a physician.
